

FERTILISER WATCH

POLESTAR INSIGHTS

REPORTING PERIOD: 18 MAY 2026 - 16 JUNE 2026

[POLESTAR-ADVISORY.COM](https://polestar-advisory.com)

EXECUTIVE SUMMARY

Fertiliser risk this month is a cost-and-supply story rather than a single dramatic event. The pressure showed up as shortage, imports and price relief. India carried the most reporting, with more from Nepal and Pakistan. The most serious reached moderate.

The reporting tracks the affordability and availability of urea, DAP and ammonia — the inputs that set planting economics. Price moves, import and subsidy decisions, and any production interruption are the levers that decide whether farmers and downstream food costs feel relief or strain.

For business users, the priority is forward cover: secure the input lines you depend on, watch for export or subsidy shifts that can reset prices quickly, and keep contingency for single-source urea and potash exposure while this picture holds.

SITUATION

Supply security, pricing and export policy stay front of mind, currently showing up as shortage, imports and price relief. The chain runs from input price and availability into farm output and onward food cost. India sits at the centre of the current reporting.

WHAT HAPPENED

Activity centred on shortage, imports and price relief. Reporting concentrated on India, with more from Nepal and Pakistan. The most serious reached moderate.

WHAT MATTERS

Fertiliser pricing and availability feed straight into planting decisions and farm input cost, and from there into the wider food security picture. When urea or DAP gets dearer or harder to source, the cost lands on the next planting cycle rather than the current invoice. Exposure to India is the live pressure point for forward stock cover and supplier conversations.

Where price pressure meets a supply or production interruption, the impact compounds: subsidy bills rise, import bills stretch, and governments lean on export controls or emergency procurement. Those interventions are the points where a slow cost story turns into a short-notice availability problem worth planning against now.

IMPLICATIONS FOR BUSINESS

- Secure forward cover on the urea, DAP and ammonia lines you depend on rather than waiting for the next price move to confirm.
- Map single-source exposure to urea and potash, and line up alternate suppliers before a shortage forces the conversation.
- Track subsidy and export-policy signals — a single notice can reset input economics and availability quickly.
- Stress-test planting and production budgets against a short-notice price spike or import interruption.
- Pull procurement conversations forward where shortage, plant outage or feedstock pressure is being reported.

WATCH NEXT

- Export restrictions and quotas — bans or curbs on urea, DAP or potash reset regional availability fast.

POLESTAR VIEW

Fertiliser Watch is flagging a supply-continuity and cost risk, not simply a rise in headlines. The standing concern is whether input price and availability hold steady enough for planting economics to work. For business users, the priority is to protect forward cover and supplier resilience against short-notice price or availability shocks. India is the clearest country to watch when planning forward cover, with the rest of the picture filled in by Nepal and Pakistan.
